/// PHARMACEUTICAL & LIFE SCIENCES

FIX ERRORS BEFORE **THEY BECOME REWORK**

Process piping, skids and cleanroom MEP are one-offs. An error found after close-in means tear-out, rework and a later start to C&Q.

XYZ field engineers verify the build against the coordinated design at set-out and at the point of install, so a deviation is raised while the position can still be changed. For every element: **is it installed, and is it installed correctly?**

EVERY WEEK A FACILITY SLIPS IS A WEEK OF PRODUCT NOT MADE.

HARDWARE

The Atom holds the coordinated model in the space to 3mm.

SOFTWARE

Each verified element rolls up from work package to portfolio.

SERVICE

Field engineers on site, following the active work. No headcount to hire.

USE CASES

01 / VERIFY CONSTRUCTION PROGRESS

Progress measured element by element against the coordinated design, by our engineers, not reported by the party doing the work.

One verified position for owner and contractor.

02 / PREVENT CONSTRUCTION ERRORS

A deviation is seen at set-out and at the point of install, while the position can still be changed.

Corrected before anything is drilled or poured.
